

Liam was performing a common household task; something that each and every one of us has probably done many times.

Liam asked his father, "Is 50 enough?"

His father said, "No, I don't think so."

Liam said, "How about 125?"

His father said, "No, I don't think that's enough either, try 90. 90 should work"

The question is, what household task was he performing where this would be true?

Scroll down for the solution...

Liam is putting the time in for heating his lunch in the microwave.

50 = 50 seconds (not enough)

125 = 1 minute and 25 seconds (not enough)

90 = 1 minute and 30 seconds
